The client's message

Hello, I'm Dev Anand, Head of Innovation at Tallis & Reeve, an engineering consultancy of around 400 people across three offices. Our staff have great ideas but they disappear into email inboxes. We want one place where anyone can submit an idea, colleagues can back the ones they like, and our innovation panel can review them properly and show people what happened. If staff can see ideas actually going somewhere, they'll keep sharing them.

Dev Anand, Head of Innovation

Who will use it

Staff:

submit ideas, browse them, vote for the ones they support, and comment

Innovation panel reviewers:

score ideas and move them through the stages

Dev (admin):

manages categories and reviewers, and reports to leadership

Starting feature list

✓ Must

- Submit an idea: title, the problem it solves, the proposed solution, category and expected impact
- Browse and search ideas; one vote per person per idea
- Pipeline stages: Submitted → Under Review → Piloting → Implemented, or Declined
- Only reviewers can move ideas between stages, and the submitter can see why
- Reviewers score ideas against set criteria (for example impact, cost and feasibility)
- A pipeline dashboard: ideas by stage, category and office

① Should

- Notify submitters when their idea changes stage
- Comments on ideas

○ Could

- Show ideas in the same category while someone is submitting, so they can spot duplicates
- A leaderboard of the most-backed ideas this quarter

What makes it interesting

It looks simple, but the difficulty is in **who can do what**. Permissions and stage rules are where AI-built apps most often cut corners, so expect your testing to be very revealing.

What this brief doesn't tell you

This brief is deliberately incomplete, just like a real one. Dev knows a lot that isn't written here. **Use the client chat to interview him**, and keep asking until you understand how ideas and the panel really work. If he says something is up to you, decide as a team and record it as an assumption in your PRD.

Stretch goals (optional) OPTIONAL

Only start one of these once all your Must stories are built and tested. They're a bonus, never needed for a strong result.

- **AI tagging and duplicate detection:** when an idea is submitted, an AI model suggests tags and flags similar ideas. (Needs an API key kept safely on a server, so not suitable for the Local-first pathway.)
- **Audit trail:** every stage change is recorded with who made it, when and why.
- **Configurable scoring:** the admin can change the scoring criteria and their weightings.
- **Chat notifications:** stage changes are posted to a team chat channel.

How your project is assessed

There's one assessed piece of work: the **Launch Showcase** on the final Friday, where your team presents your app live and explains how you built it. Both your **product** and your **presentation** are marked. Your requirements, design, logs and other documents aren't marked, but they'll help you build a better app and they're your best evidence in the showcase. Stretch goals aren't needed for a top mark.

Remember

- Use **fictional data only**. Never put real names, emails or other personal information into your app or the client chat.
- If the client chat ever contradicts this brief, **the brief is right**. Raise it at your next check-in.
